

CNN Practice Test Questions and Answers

1. Dialysate glucose must be heat sterilized at a low pH to

- A) Increase generation of glucose degradation products
- B) Decrease generation of glucose degradation products
- C) Prevent the dialysate from becoming cloudy
- D) Prevent crystallization in the dialysate

2. The use of an amino-based dialysate solution is primarily for

- A) Decreased ultrafiltration
- B) Increased ultrafiltration
- C) Nutritional supplementation
- D) Electrolyte imbalance

3. What are the three layers of the glomerular membrane made up of?

- A) Endothelial
- B) Epithelial
- C) All of the above
- D) Basement membrane

4. What is the primary purpose of a pooling layer in a Convolutional Neural Network?

- A) To introduce non-linearity into the network.
- B) To reduce the spatial dimensions of the feature maps.
- C) To increase the number of parameters in the model.
- D) To perform feature extraction by applying filters.

Answers: 1-B 2-C 3-C 4-B
