

# NACE Practice Test Questions and Answers

## 1. What design practice helps minimize crevice corrosion?

- A) Using thicker materials.
- B) Avoiding sharp corners and ensuring proper drainage.
- C) Increasing the surface roughness.
- D) Applying a single coat of paint.

## 2. What is the purpose of a DFT (Dry Film Thickness) gauge?

- A) To measure the wet film thickness.
- B) To verify the coating's color.
- C) To check the cured coating thickness for compliance.
- D) To detect holidays in the coating.

## 3. What is the primary purpose of cathodic protection (CP)?

- A) To increase the electrical resistance of the metal
- B) To provide a decorative finish to the metal surface
- C) To control corrosion by making the metal a cathode
- D) To insulate the metal from all environments

## 4. What is the purpose of a reference electrode in CP systems?

- A) To supply current to the system
- B) To measure the electrical potential of the protected structure
- C) To replace sacrificial anodes
- D) To increase soil resistivity

**Answers: 1-B 2-C 3-C 4-B**
